

Codes ATC: En attente

Indication	Hypovolaemia <span style="border: 1px solid gray; padding: 2px;">Code ICD11: 5C70.1</span>
INN	Polygeline
Type de médicament	Chemical agent
Type de liste	Liste de base
Formulations	Parenteral > General injections > IV: 3.5% in solution
Historique des statuts LME	Ajouté pour la première fois en 1989 (TRS 796) Retiré en 2005 (TRS 933)
Sexe	Tous
Âge	Adolescents et adultes
Équivalence thérapeutique	Des médicaments appartenant à la même classe pharmacologique peuvent être utilisés

### Résumé des preuves et recommandation du comité d'experts

In 2003 the Expert Committee recommended reviewing polygeline for possible fast-track deletion at the meeting in 2005. One review was received from the ISDB and one from Médecins Sans Frontières. A Cochrane review (1) of 57 trials involving 3659 patients compared the effects of different colloid solutions in patients thought to need blood volume replacement. It showed that there is no evidence that one colloid solution is more effective or safer than any other. Another Cochrane review (2) indicated that there is no evidence from randomized controlled trials that resuscitation with colloids, compared with resuscitation with crystalloids, reduces the risk of death in patients with trauma or burns or following surgery. The Committee also noted that the cost of polygeline (US\$ 0.0126/ml) is twice that of dextran 70 in normal saline (US\$ 0.0056/ml) (12). The Committee concluded that polygeline and dextran 70 are similar in safety and efficacy. The Committee decided that, in view of its lower price, dextran 70 should be retained on the Model List, with a square box to cover polygeline. The choice made will depend on national circumstances. A full review of colloids compared with crystalloids would be welcome at the next meeting of the Committee. References: 1. Bunn F, Alderson P, Hawkins V. Colloid solutions for fluid resuscitation.
