The Expert Committee recommended the current listings of cytarabine, immunoglobulin, mercaptopurine, methotrexate, prednisolone, vinblastine and vincristine on the complementary list of the EML and EMLc be extended to include the new indication of Langerhans cell histiocytosis (LCH). While LCH is considered a rare disease, the Committee acknowledged that treatment is associated with very high survival rates in many cases. These medicines are recognized as part of the standard of care for children with LCH. Their benefits and harms were accepted as being well established from use in other indications in children and in adults.
